

ABSTRACT

The invention relates to an installation for continuous treatment of a textile web of fabric (1) which has free longitudinal edges (2) and is stretched in the longitudinal direction (3), the longitudinal edges (2) of the web of fabric (1) being prevented from turning back by staples (8). In order to mechanize the application of the staples (8), a staple gun (17) comprising a staple magazine (15) is associated with the respective longitudinal edge (2) at a point on the installation at which the edge is not normally turned back yet.
